

# Benefits of using RainSmart

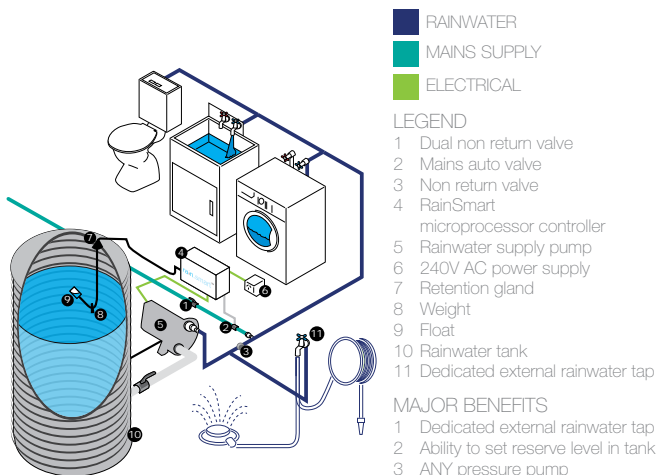

## RainSmart benefits you and the environment.

RainSmart has been designed and built in Australia, for Australian conditions to ensure maximum benefit to our customers.

RainSmart can be used with various pumps on different installation types. It is designed to ensure your rain tank water is used automatically when available in selected applications in the home such as toilets and laundry: a legislative requirement for new homes in most Australian states.

## Why be RainSmart?

RainSmart provides the owner with full, hassle free automation and unlike other systems in the market: control and flexibility. RainSmart allows the owner to easily set a reserve water level in the rain water tank. This reserve can then be used externally if restrictions are applied by local councils, when, where and how the owner chooses. This is done through a dedicated rainwater tap or outlet installed after the pressure system but prior to the isolating mains valve junction.

## How does RainSmart work for you?

No need for manual switching from mains water to tank water as with other systems. RainSmart will constantly monitor the water level in your tank. When the water level in your tank reaches the level preset by you, it will automatically switch to mains water thus delivering uninterrupted water supply to your toilets and laundry. When rain water tops up the tank sufficiently, RainSmart will automatically revert back to using your tank water again.

In some systems mains water is introduced into the tank. In others, tank water is only plumbed together with mains water. Neither system allows you to use your rain water the way you want. More importantly, if the pump fails in either of the above systems, or if power is lost, water supply to your toilets and laundry will be lost. In both cases, however, RainSmart will automatically switch to mains water supply thus ensuring a continuous supply of water to your toilets and laundry.

Again, when water usage restrictions are applied, neither of the above systems allows you to water your garden or wash your car. RainSmart however will allow you to use your tank water for these and other purposes as you wish.

## \$ave. \$ave. \$ave.

Water has become not only a very scarce resource, but also a very expensive one, forecast to become even more so.

An efficient rain water collection and distribution system therefore not only makes good environmental sense but also good sound economic sense.

With other systems you will not know when you are using mains water or tank water for either external or internal use: with RainSmart you will not only know at all times, but you can also control how and when it uses either water source, saving you money.

The dedicated external outlet, possible with RainSmart, will only provide water when tank water is available.

## Benefits of using RainSmart.

RainSmart is a Smart water flow control system. It incorporates the latest and most sophisticated electronic valve control systems, programmed to give you what you need:

- Water when and how you want it.
- A dedicated external water supply
- Easy to set reserve tank water supply
- Fully automatic operation
- Continuous monitoring of tank water level
- No loss of water supply during power failures
- No loss of water supply if pump fails
- No loss of water supply when tank water level is low
- \$avings, \$avings, \$avings

But the best reason for being RainSmart is choice.
